Title: Secure Messaging for Healthcare, Government, Business & Finance

(Press Release, Florence, SC) **Heritage Digital, A SATIS Company**

Heritage Digital released their T2Me™ product today which provides a cost-effective solution to secure messaging and file transfers.

Instant messaging is a great way to improve communications and work more efficiently. But commercial instant messenger systems are not secure. As medical providers know, email is not a secure method with which to transfer files.

Medical providers work with a number of departments within the organization, in branch offices and outside the office, such as insurers and billing agencies. Timely communication is important. Until now, secure instant messaging and file transfers were expensive and difficult to use. With T2Me™ a familiar instant messenger interface is used. Messages are instant and users can “drag-and-drop” a document onto the interface for immediate transfer to any other T2Me user. This makes it easy to send lab reports, billing information and other critical information to offices, referring physicians and insurers.

Finance institutions have many of the same privacy issues as healthcare organizations. T2Me™ provides all the benefits of a public messaging system without the security issues.

Government organizations face the same issue. Instant messaging can allow offices to work more efficiently, but security is a concern. T2Me™ allows users to setup organizational communications and instantly send files and data between offices or across town.
